Wednesday Challenge Form

Group Members: Paul and Aren

Problem Statement: We were told to estimate how many pieces of candy corn it takes to cover an entire piece of paper.

Approach: What we did was we first measured the width and length of the base of the candy corn (they would be standing up). After that we measured the paper and we counted how many will fit.

Solution: We multiplied the length and width with each other and we went with that number.

Lessons Learned: Pay attention in math class.
